

Subzero 085D UV Inkjet Lamps

The Subzero 085D is slightly longer with higher wattage than its cousin the Subzero 055A. Ceramic end cap and wire lengths are identical. Printers include MacDermid ColorSpan, Fuji, HP, Inca, IP&I and Oce.

Like the 055A, this lamp is normally only available from the OEM mounted into a cassette.

TCS Technologies has an alternative solution. While we do sell the lamp alone, most companies opt to have us install the lamp into their existing cassette. For only \$65.00 additional to lamp cost, we clean, polish, and install a new TCS Technologies UV curing lamp into your existing cassette. You receive your cassette ready to fit directly back into your machine. Most companies opt for this service. Frankly it is the safest and easiest method. Typically, we have your cassette for one business day.

At the time of this revision, you could have TCS Technologies rebuild 3-Subzero 085D style cassettes for the price of 1-OEM product.

For examples of cleaned Subzero cassettes, please see our UV lamp installation section of this website.

TCS Technologies manufactures the lamps it sells. Remember, less expensive does not mean inferior quality. Our lamps are made in the USA and we have done so for thirty-two (32) years. We know what is required to produce a quality UV lamp. Trust TCS Technologies to provide a reliable product backed by years of UV lamp-making experience.
